

I implemented all core requirements of the article-sharing web application, including secure user registration and login, posting article URLs to a shared message board, viewing all posted links, and allowing users to delete only their own posts. An admin account with the default credentials “admin/admin” is automatically created and can delete posts from any user. All user data and posts are stored in a persistent local database, and passwords are securely hashed. Input validation, access control checks, and general OWASP-aligned security practices were followed to ensure safe handling of accounts and data.
